The king of Great Britain, as sovereign patron, had formerly the appointment of all ecclesiastical dignities; investing by crosier and ring, and afterward by letters patent. But now the king, on demand, sends his *congé d'élire* to the dean and chapter, with a letter missive, containing the name of the person he would have them elect, and if they delay the election twelve days, the nomination devolves on the king, who may appoint by letters patent.

CONGELA'TION, *n.* [Lat. *congelatio.*] The process of passing, or the act of converting, from a fluid to a solid

state; or the state of being congealed; concretion. It differs from crystallization in this: in congelation the whole substance of a fluid may become solid; in crystallization, when a salt is formed, a portion of liquid is left. But the congelation of water is a real crystallization. Chemistry supplies many means for promoting the congelation or freezing of liquids. The combined powers of rarefaction, vaporization, and absorption, are capable of effecting even the congelation of mercury. The late Sir John Leslie discovered a method by which a quantity of water may be converted into ice in the hottest weather, and kept in that state for a considerable time. This he effected by introducing a surface of sulphuric acid, which has a powerful attraction for water, under the receiver of an air-pump, and also a watch-glass filled with water. After a few strokes of the pump, the water was converted into a solid cake of ice. Freezing apparatus, constructed on this principle, are now employed in hot climates for producing ice.

When the cutting plane passes through the apex of the cone, and coincides with the axis, or passes through the apex and any part of the base, the section is a triangle, as in fig. 1. When the plane cuts the axis at right angles, the section is a circle, as in fig. 2. When the plane cuts the axis obliquely, and passes through both sides of the cone, the section is an ellipse or oval, as in fig. 3. When the plane cuts the axis in a line parallel to one side of the cone, the section is a parabola, as in fig. 4. And lastly, if the section be made parallel to the axis, or so as to make a greater angle with the base than that which it makes with the side of the cone, it will be an hyperbola, as in fig. 5. The term *conic sections* is applied more peculiarly to the last three figures, and the doctrines of their several properties constitute one principal branch of geometry, of great importance in physical and geometrical astronomy, as well as in the physico-mathematical sciences.—*Conical valve*, the puppet or T valve, first used by Watt in the construction of

Others question the propriety of considering conscience as a distinct faculty or principle. They consider it rather as the general principle of moral approbation or disapprobation, applied to one's own conduct and affections; alleging that our notions of right and wrong are not to be deduced from a single principle or faculty, but from various powers of the understanding and will.

By phrenologists, *conscientiousness* is classed among the sentiments proper to man. Its organ is situated towards the posterior and lateral parts of the head, on each side of Firmness, and marked 16. When it is very energetic the individual is strongly disposed to act justly, from the mere love of justice, and is highly disgusted at beholding an action in the least degree connected with unjust principles. Agreement of the mind to what is proposed or stated by another; accord; hence, a yielding of the mind or will to that which is proposed; as, a parent gives his *consent* to the marriage of his daughter. We generally use this word in cases where power, rights, and claims are concerned. We give *consent*, when we yield that which we have a right to withhold; but we do not give *consent* to a mere opinion, or abstract proposition. In this case, we give our *assent*. But *assent* is also used in conceding what we may withhold. We give our *assent* to the marriage of a daughter. Consequently, *assent* has a more extensive application than *consent*. But the distinction is not always observed. *Consent* often amounts to *permission*.

Thus, the stone in the bladder, by vellicating the fibres, will produce spasms and colic in the bowels; a shameful thing seen or heard will produce blushing in the cheeks. But many facts indicate that other causes than nervous communication produce sympathy.

He was obliged, antecedent to all other *considerations*, to search an asylum. *Dryden.*

6. Reason; that which induces to a determination; as, he was moved by the *considerations* set before him.—7. In *law*, the reason which moves a contracting party to enter into an agreement; the material cause of a contract; the price or motive of a stipulation. In all contracts, each party gives something in exchange for what he receives. A contract is an agreement, upon sufficient *consideration*. This consideration is *express* or *implied; express*, when the thing to be given or done is specified; *implied*, when no specific consideration is agreed upon, but justice requires it and the law implies it; as, when a man labours for another, without stipulating for wages, the law infers that he shall receive a reasonable *consideration*. A good *consideration* is that of blood, or natural love; a valuable *consideration* is such as money, marriage, &c. Hence a *consideration* is an equivalent or recompense; that which is *given* as of equal estimated value with that which is *received*. In *Scots law*, when value in money or goods or services has been given in return for a deed granted, the *consideration* is said to be *onerous;* when a deed is granted without value, and from mere love and favour to the grantee, the consideration is termed *gratuitous.*

CONSID'ERING, *ppr.* Fixing the mind on; meditating on; pondering; viewing with care and attention; deliberating on. *Note.* We have a peculiar use of this word, which may be a corruption for *considered*, or which may be a deviation from analogy by an insensible change in the structure of the phrase. "It is not possible for us to act otherwise, *considering* the weakness of our nature." As a participle, this word must here refer to *us*, or the sentence cannot be resolved by any rule of English syntax. It would be correct to say, "It is not possible for us to act otherwise, the weakness of our nature being *considered;*" or, "We, *considering* the weakness of our nature, cannot act otherwise." But the latter phrase is better grammar than it is sense. We use other participles in like manner; as, "*Allowing* for tare, the weight could not be more than a hundred pounds." These and similar phrases are anomalous. But *considering* is no more a *kind of conjunction*, in such a phrase, than it is a *noun.*

CONSID'ERING, *n.* The act of deliberating, or carefully attending to; hesitation; as, many mazed *considerings.*

In *music*, consonance is an accord of sounds which produces an agreeable sensation in the ear, as the third, fifth, and eighth. It denotes also the according intervals. CON'SONANT, *n.* A letter, so named because it is considered as being sounded only in connection with a vowel. But some consonants have no sound, even when united with a vowel, and others have a very imperfect sound. The consonants are better called *articulations*, as they are the names given to the several closings or junctions of the organs of speech, which precede and follow the openings of the organs, with which the vowels are uttered. These closings are perfect, and wholly intercept the voice, as in the syllables *ek*, *ep*, *et;* or imperfect, and admitting some slight sound, as in *em*, *en*. Hence some articulations are called *mutes*, and others *semi-vowels*. The consonants begin or end syllables, and their use is to determine the manner of beginning or ending the vocal sounds. These closings or configurations of the organs being various, serve to diversify the syllables, as in uttering *ba*, *da*, *pa*, or *ab*, *ad*, *ap;* and although *b* and *p* may be considered as representing no sounds at all, yet they so modify the utterance of *ab*, *ap*, or *ba*, *pa*, that the slight difference between these articulations may be perceived as far as the human voice can be distinctly heard.

The Lord High Constable of England, once seventh officer of the crown. He had the care of the common peace, in deeds of arms, and matters of war; being a judge of the court of chivalry, also called the court of honour. To this officer and to the Earl Marshal belonged the cognizance of contracts, deeds of arms without the realm, and combats and blazonry within the realm. The power of this officer was so great and so improperly used, that it was abridged by the 13th Richard II., and was afterwards forfeited in the person of Edward Stafford, duke of Buckingham, in 1521. It has never been granted to any person since that time, except

pro hac vice, or on a particular occasion. - 2. An officer of the peace. In *England*, there are high constables, petty constables, and constables of London. The high constables are chosen at the court leets of the franchise or hundred, over which they preside, or in default of that, by the justices of the quarter sessions, and are removable by the same authority that appoints them. The petty constables are chosen by the jury of the court leet, or if no court is held, they are appointed by two justices of the peace. In London, a constable is nominated in each precinct by the inhabitants, and confirmed at the court of wardmote. The duty of constable is to keep the peace, and for this purpose they are invested with the power of arresting and imprisoning, and of breaking open houses.--A *special constable*, is a person appointed to act as constable upon a particular occasion, as in the case of an actual or apprehended riot.—*Lord high constable of Scotland*. The office of lord high constable of Scotland, is one of great antiquity and dignity. He had anciently the command of the king's armies while in the field, in the absence of the king. He was likewise judge of all crimes or offences committed within four miles of the king's person, or within the same distance of the parliament or of the privy council, or of any general convention of the states of the kingdom. The office is hereditary in the noble family of Errol, and is expressly reserved in the treaty of Union. In *Scotland*, constables are appointed by the justices of the peace at their quarter sessions, two at least for every parish; but in royal burghs, they are appointed by the magistrates. In the *United States*, constables are town or city officers of the peace, with powers similar to those possessed by the constables in Great Britain. They are invested also with powers to execute civil as well as criminal process, and to levy executions. It used to be held during the session of parliament, and consisted of an upper and lower house. In the upper house sat the archbishops and bishops; in the lower house the inferior clergy, represented by their proctors, consisting of all the deans and archdeacons, of one proctor for every chapter, and two for the clergy of every diocese, in all, one hundred and forty-three divines, viz., twenty-two deans, fifty-three archdeacons, twenty-four prebendaries, and forty-four proctors of the diocesan clergy. In former times, Convocations had the power of enacting canons, but this power was virtually abolished by the statutes of Henry VIII., Elizabeth, and Charles II.; since that time the Convocation has had no business to transact, and it has become customary to prorogue it every year immediately upon its assembling.—4. *House of convocation*, in *the University of Oxford*, is the assembly which enacts, amends, &c., laws and statutes; elects burgesses, many professors, and other officers, &c. Next to gold, silver, and platinum, it is the most ductile and malleable of the metals, and it is more elastic than any metal except steel, and the most sonorous of all the metals. It is found native in laminæ or fibres, in a gang almost always quartzose; it is also found crystallized, and in grains or superficial laminæ on stones or iron. It is not altered by water, but is tarnished by

exposure to the air, and is at last covered with a green carbonate oxide. Copper in sheets is much used for covering the bottoms of ships, for boilers and other utensils; mixed with tin and zinc, it is used in enamel painting, dyeing, &c.; mixed with tin, it forms bell-metal; with a smaller proportion, bronze; and with zinc, it forms brass, pinchbeck, &c. When taken into the body it operates as a violent emetic, and all its preparations are violent poisons. CRED'IBLE, *a.* [Lat. *credibilis.*] 1. That may be believed; worthy of credit. A thing is *credible,* when it is known to be possible, or when it involves no contradiction or absurdity: it is *more credible,* when it is known to come within the ordinary laws or operations of nature. With regard to the Divine Being and his operations, every thing is *credible* which is consistent with his perfections, and supported by evidence or unimpeachable testimony, for his power is unlimited. With regard to human affairs, we do not apply the word to things barely *possible,* but to things which come within the usual course of human conduct, and the general rules of evidence.—2. Worthy of belief; having a claim to credit; *applied to persons.* A *credible* person is one of known veracity and integrity, or whose veracity may be fairly deduced from circumstances. Esteem; estimation; good opinion founded on a belief of a man's veracity, integrity, abilities and virtue; as, a physician in high *credit* with his brethren. Hence, 3. Honour; reputation; estimation; *applied to men or things.* A man gains no *credit* by profaneness; and a poem may lose no *credit* by criticism. The *credit* of a man depends on his virtues; the *credit* of his writings, on their worth. 4. That which procures, or is entitled to belief; testimony; authority derived from one's character, or from the confidence of others. We believe a story on the *credit* of the narrator. The purchaser takes what is sold, on *credit.* In like manner, money is lent on the *credit* of the borrower.—7 The capacity of being trusted; or the reputation of solvency and probity which entitles a man to be trusted. A customer has good *credit* or no *credit* with a merchant.—8. In *book-keeping,* the side of an account in which payment is entered; opposed to *debit.* This article is carried to one's *credit,* and that to his *debit.* We speak of the *credit* side of an account.—9. *Public credit,* the confidence which men entertain in the ability and disposition of a nation to make good its engagements with its creditors; or the estimation in which individuals hold the public promises of payment, whether such promises are expressed or implied. The term is also applied to the general credit of individuals in a nation; when merchants and others are wealthy, and punctual in fulfilling engagements; or when they transact business with honour and fidelity; or when transfers of property are made with ease for ready payment. So we speak of the *credit* of a bank, when general confidence is placed in its ability to redeem its notes; and the *credit* of a mercantile house rests on its supposed ability and probity, which induce men to *trust* to its engagements. When the *public credit* is questionable, it raises the premium on loans.

Cherish *public credit.* *Washington.*

This word seems to have been introduced by the use of the Latin *credo*, *I believe*, at the beginning of the apostles' creed, or brief system of Christian faith. Lat. *credo;* W. *credu*. CRIME, *n.* [Lat. *crimen;* Gr. κριμα. This word is from the root of Gr. κρινω, Lat. *cerno*, to separate, to judge, to decree, to condemn. The Gr. κριμα is undoubtedly a contraction, for in Norman the word is *crisme*. The root then of these derivatives is the same as of the Ir. *criathar*, a sieve, W. *rhidyll*, Eng. *riddle;* W. *rhidiaw*, to secrete, to separate. We have *screen*, a riddle, from the root of κρινω, and *riddle*, from the Celtic root of κρισις, κριτης. The minor wrongs committed against individuals or private rights, are denominated *trespasses*, and the minor wrongs against public rights are called *misdemeanours*. Crimes and misdemeanours are punishable by indictment, information, or public prosecution; trespasses or private injuries, at the suit of the individuals injured. Linnæus gave them their name, upon the supposition that they in fact do possess sexual organs, although he was unable to discover them. Since his time, several botanists have attempted to show that sexes do exist in them, although in a concealed and anomalous state. From the most recent observations, it seems not improbable that male and female organs exist in such plants, although in a state of intimate intermixture.

CRYS'TAL, *n.* [Lat. *crystallus;* Gr. κρυσταλλος: Ger. *krystall;* W. *crisial,* from *cris,* it is said, a hard *crust.* It is from the same root as *crisp,* and W. *cresu,* to parch; *crest,* a crust; *crasu,* to roast. The Greek, from which we have the word, is composed of the root of κρυος, frost, a contracted word, probably from the root of the Welsh words, supra, and στελλω, to set. In *chem.* and *miner.,* an inorganic body, which, by the operation of affinity, has assumed the form of a regular solid, terminated by a certain number of plane and smooth surfaces. A vast number of mineral and saline substances, and also many vegetable and animal products, are capable of assuming this regular geometrical form. The chemist procures crystals, either by fusing the bodies by heat, and allowing them gradually to cool, or by dissolving them in a fluid, and then abstracting the fluid by slow evaporation.—2. This process is the effect of refrigeration or evaporation. 2. The mass or body formed by the process of crystallizing.

CRYSTALLOG'RAPHY, *n.* [*crystal*, as above, and γραφη, description.] 1. The doctrine or science of crystallization, teaching the principles of the process, and the forms and structure of crystals. According to Haüy, the *primitive form* of crystals is a solid of a constant form, inserted symmetrically in all the crystals of the same species, and the faces of which observe the direction of the layers which compose these crystals. The primitive forms are reducible to six, viz. the parallelopipedon, which includes the cube, the rhomb, and all the solids which are terminated by six faces, parallel two and two; the tetraedron; the octahedron; the regular hexahedral prism; the dodecahedron, with equal and similar rhomboidal planes; and the dodecaedron, with triangular planes. Haüy, by farther subdivision of these primitive forms, reduced them to three forms, to which he gave the name of *integral particles*, the union of which constitutes the crystal. These are the tetraedron, the simplest of all pyramids; the triangular prism, the simplest of prisms; and the parallelopipedon, the simplest of all solids which have their faces parallel two and two. Dr. Wollaston supposed the primitive particles of crystals to be spheres, and it is certain that the various forms of crystals may be produced by placing balls upon one another in different ways. The study of crystallography is of great importance to the chemist and mineralogist, as the nature of many substances may be ascertained from an inspection of the forms of their crystals.—2. A discourse or treatise on crystallization.

The true cuckoo tribe, to which the typical appellation Cuculus is now restricted, are all natives of the Eastern continent. The common

Common Cuckoo (Cuculus canorus).

European cuckoo, Cuculus canorus, is a bird about the size of a small pigeon, or rather appearing of that size, from the very great quantity of feathers with which it is clothed. The well-known vernal call-note of this species is generally first heard in the south of England, about the middle of April. The call-note is very much affected by the state of the weather, being of a hoarse nature during very dry weather, and becoming musical and distinct in moist weather. This bird, like the *cow-bunting*, deposits its eggs in the nest of some other species, generally in that of the shore-pipit, or pied water-wagtail. The young cuckoo ejects from the nest its young companions as soon as they are hatched. The old cuckoos leave this country in the first week of July, retiring southward; but the young cuckoos remain till September. Where the mass of them spend the winter is not well ascertained.

the peculiar manner of its bending or flexure, by which it becomes a curve of such and such peculiar properties. Thus the nature of the curvature of a circle is such, that every point in the circumference is equally distant from a point within called the centre, and so the curvature of the same circle is everywhere the same; but the curvature in all other curves is continually varying.—*Circle of curvature*, or *circle of the same curvature*, a circle which touches a curve in a point, so that no other circle touching it in the same point can pass between it and the curve.—*Radius of curvature*, the radius of the circle of curvature.—*Double curvature*, a term applied to the curvature of a line which twists, so that all the parts of it do not lie in the same plane; as, the rhumb line, or the loxodromic curve.

The doctrine of curves and of the figures and solids generated from them, constitutes what is called the higher geometry, and forms one of the most interesting and important branches of mathematical science. Curve lines are distinguished into algebraical, or geometrical, and transcendental or mechanical. The varieties of curves are innumerable; that is, they have different degrees of bending or curvature. The curves most generally referred to, besides the circle, are the ellipse, the parabola, and the hyperbola, to which may be added the cycloid.

CUT, *v. t. pret.* and *pp. cut.* [Norm. *cotu,* cut. This word coincides in elements with the W. *cat,* a piece, *cateia,* to cut, *cwta,* short, *cwtau,* to shorten, and with *ysgythru,* to cut off, to lop, to shred, to carve, which Owen deduces from *ysgwth,* a push, from *gwth,* a push or thrust, *gwthiaw,* to push, thrust, press. Whether *cut* is derived to us from the Welsh or not may be a question; but I have not found the word in any of the Gothic or Teutonic languages. It is obviously from a common root with the Lat. *cædo* and *cudo,* and the primary sense is to thrust, to drive, to strike; and to *cut off* is primarily to *strike off.* We have proof of this in our own language; for a stroke with a whip is called a *cut.* The fact is the same with many other words which now signify, to separate with an edged tool.] 1. CY'CLOID, *n.* [Gr. κυκλος, circle, and ειδος, form.] A geometrical curve on which depends the doctrine of pendulums; a figure made by the upper end of the diameter of a circle, turning about a right line. The genesis of a cycloid may be conceived by imagining a nail in the circumference of a wheel;

the line which the nail describes in the air, while the wheel revolves in a right line, is the cycloid. The cycloid is the curve of swiftest descent, that is, a heavy body descending by the force of its own gravity will move from one point of this curve to any other point, in less time than it will take to move in any other curve which can be drawn between these points. Also, a body falls through any arc of an inverted cycloid in the same time, whether the arc be great or small. In the figure, let the circle B C A, of which the diameter is A B, make one revolution upon the straight line A B A, equal to its circumference; then the curved line

Cycloid.

A C A G A, traced out by that point of the circle which was in contact with the point A in the straight line, when the circle began to revolve, is called a *cycloid*. The following are some of its properties. If the generating circle be placed in the middle of the cycloid, its diameter coinciding with the cycloidal axis A B, and from any point C in the curve, there be drawn the tangent C F, the ordinate C D E perpendicular to the axis, and the chord A D of the circle; then, C D = the circular arc A D; the cycloidal arc A C = double the chord A D; the semi-cycloid A C A = double the diameter A B; and the tangent C F is parallel to the chord A D.

D, in the English alphabet, is the fourth letter and the third articulation. It holds the same place in the English as in the Chaldee, Syriac, Hebrew, Samaritan, Greek, and Latin alphabets. In the Arabic, it is the eighth; in the Russian, the fifth; and in the Ethiopic, the nineteenth letter. D is a dental articulation, formed by placing the end of the tongue against the gum just above the upper teeth. It is nearly allied to T, but is not so close a letter, or rather it does not interrupt the voice so suddenly as T, and in forming the articulation, there is a lingual and nasal sound, which has induced some writers to rank D among the lingual letters. It has but one sound, as in *do*, *din*, *bad;* and is never quiescent in English words, except in a rapid utterance of such words as *handkerchief.* As a numeral, D represents *five hundred*, and when a dash or stroke is placed over it thus, D̄, it denotes *five thousand.* As an abbreviation, D. stands for Doctor; as M.D. Doctor of Medicine; D.T. DAY, *n.* [Sax. *dæg, deg, dag;* D. *dag;* Ger. *tag;* W. *dydh;* Lat. *dies. See* DAWN.] 1. That part of the time of the earth's revolution on its axis, in which its surface is presented to the sun; that space of time during which it continues to be light in contradistinction to night, or that portion of time during which it is dark; but the space of time in which it is light being somewhat vague and indeterminate, the time between the rising and setting of the sun is usually termed the day, and constitutes what astronomers call the artificial day—"And God called the light *day;*" Gen. i.—2. The whole time or period of one revolution of the earth on its axis, or twenty-four hours; called the *natural* day.

In this sense, the day may commence at any period of the revolution. The Babylonians began the day at sun-rising; the Jews, at sun-setting; the Egyptians, at mid-night, as do several nations in modern times, the British, French, Spanish, American, &c. This day, in reference to civil transactions, is called the *civil* day. Thus with us the day when a legal instrument is dated, begins and ends at midnight. In *astronomy,* a *natural* or *solar day* is usually considered to be the interval between the sun's leaving the meridian and his return to it. The length of this day is continually varying, owing to the eccentricity of the earth's orbit, and the obliquity of the ecliptic. A *mean solar day* is a mean of all the natural or solar days in the year. A *sidereal day* is the time of one apparent revolution of the fixed stars. It is uniformly equal to 23 h. 56 m. 4.098 sec.—3. Light; sunshine.

Dumbness is the usual concomitant of deafness, but in many cases, dumbness does not proceed from any original defect in the organs of speech or from any mental incapacity, but from the want of the sense of hearing, which sense enables us to imitate articulate sounds, and to acquire speech. Instead therefore of the usual name of *deaf and dumb* applied to such persons, it has been proposed to substitute *deaf-mute*, which may be used as a noun and an adjective.—2. DEAN, *n.* [Fr. *doyen*, the eldest of a corporation; Arm *dean;* It. *decano;* from Lat. *decanus*, the leader of a file ten deep, the head of a college, from *decem*, Gr. δέκα, W. *deg*, ten; so named because originally he was set over ten canons or prebendaries.] 1. In *England*, an ecclesiastical dignitary in a cathedral or a collegiate church, and the head of a chapter; the second dignitary of a diocese. Anciently deans were elected by the chapter, in virtue of a congé d'élire from the king and letters missive of recommendation; but in the chapters founded by Henry VIII out of the spoils of dissolved monasteries, the deanery is donative, and the installation merely by royal letters patent. —*Rural dean*, or arch-presbyter, had originally jurisdiction over ten churches; but afterward he became only the bishop's substitute, to grant letters of administration, probate of wills, &c. His office is now lost in that of the archdeacon and chancellor.—*Dean of a monastery*, a superior established under the abbot, to ease him in taking care of ten monks. Hence his name. —*Dean and chapter* are the bishop's council, to aid him with their advice in affairs of religion, and they may advise, likewise, in the temporal concerns of his see.—*Dean of guild*, in *Scotland*, is that magistrate of a royal burgh who is head of the Merchant Company or guildry. The proper duty of this magistrate now is, to take care that all buildings within the burgh are sufficient; that they are erected agreeably to law; and that they do not encroach either on private or public property He may order insufficient buildings to be taken down; but in other respects his jurisdiction is confined to possessory questions. By the burgh reform act, it is declared, that while the right of the guildry to elect their dean shall be preserved, he shall no longer be recognised as an official and constituent member of the town council, and that his functions shall be performed by a member of the council, elected by the majority of councillors. But the deans of guild in Edinburgh, Glasgow, Aberdeen, and Perth, elected as heretofore, are continued as constituent members of the council to perform all the functions of their office.—*Dean of guild court.* In *Edinburgh*, this court consists of the dean of guild, the old dean of guild, and a council of merchants and tradesmen annually chosen. The law assessors of the magistrates of Edinburgh act as assessors. The jurisdiction of the court is confined to the regulation of buildings within the royalty, and to such matters of police as have any connection with buildings. The court has also a jurisdiction in regulating weights and measures. The dean of guild courts in other royal burghs, of sufficient size, have an analogous jurisdiction.—*The dean of faculty*, one who is appointed by the faculty of advocates in Edinburgh, to preside at their meetings, and to sign the acts of the faculty.—*Deans of the chapel royal*, a title bestowed on one or more clergymen of the church of Scotland, who receive from the crown a portion of the revenues which formerly belonged to the chapel royal in Scotland, and which are now in the gift of the crown. —2. The state of the dead; as, the gates of *death;* Job xxxviii.—3. The manner of dying.

The general number of distinct strokes in succession, is from seven to nine or eleven. To produce the sound, the animal raises itself upon its hind legs, with the body somewhat inclined, and beats its head with a great force and agility upon the plane of position, and its strokes are so powerful as to make a considerable impression, if they fall upon any substance softer than wood.

Increasing or diminishing by ten; as, *decimal* numbers; *decimal* arithmetic.—3. A *decimal* fraction or *decimal,* is a fraction whose denominator is 10, or some number produced by the continued multiplication of 10 as a factor; such as 100, 1000, &c. In the notation of decimals the denominator is usually omitted, and, to indicate its value, a point is placed to the left of as many figures of the numerator, as there are ciphers in the denominator. Should there not be a sufficient number of figures in the numerator, as many ciphers are prefixed as supply the deficiency. Thus $\frac{7}{10}$, $\frac{9}{100}$, $\frac{3}{1000}$, $\frac{1}{100}$, or $4\,\frac{75}{100}$ are decimals, and are usually written .7, .09, .003, 4.75. From the notation of decimals, it is evident that the figure immediately following the decimal point, denotes tenths, the next figure hundredths; the third, thousandths, &c. Hence, the values of figures in decimals, as well as in whole numbers, are increased in a tenfold ratio by removing them one place towards the left hand, and diminished in the same ratio by removing them one place to the right; and hence also, all operations in decimals are performed in exactly the same manner as those in whole numbers, due attention being paid to the position of the separating point. *Decimal arithmetic,* in a general sense, denotes the common system of arithmetic, in which the decimal or denary scale of numbers is used, or in which the places of the figures change their value in a tenfold proportion, the value being ten times greater for every place more towards the left hand, and ten times less for every place more towards the right.

In a more restricted sense, however, the term is applied to decimal fractions. *Decimal measure*, a measure, the unit of which is divided into ten equal parts. —4. Tenth; as, a *decimal part*.

DECOMPOSI''TION, *n.* Analysis, the act of separating the constituent parts of a substance, which are chemically combined. When compounds are resolved into their elements, or when the chemical constitution of substances is altered, they are said to be *decomposed;* and when in this operation new products are formed, such products are called the *results of decomposition* Thus ammonia is the result of the decomposition of most animal substances; carburetted hydrogen is the result of the decomposition of pit-coal, &c. Chemists use the terms *simple* and *compound*, or *single* and *double* decomposition, to distinguish between the less and more complicated cases. When a compound of two substances is decomposed by the intervention of a third, which is itself simple, or which acts as such, the case is one of simple decomposition. Water, for instance, is a compound of oxygen and hydrogen. When the metal potassium is thrown into water, it decomposes it; the hydrogen is liberated in the form of gas, and the oxygen combines with the potassium to form potassa. When two new compounds are produced, the result is called *double*, or *complex* decomposition. Thus, when potassa (composed of potassium and oxygen), and hydrochloric acid (composed of hydrogen and chlorine), react upon each other, chloride of potassium (composed of chlorine and potassium), and water (composed of hydrogen and oxygen), are the results. Decomposition differs from mechanical division, as the latter effects no change in the properties of the body divided, whereas the parts chemically decomposed have properties very different from those of the substance itself. The decomposition of bodies forms a very large part of chemical science. It seems probable from the operations we are acquainted with, that it seldom takes place but in consequence of some new combination or composition having been effected. Organic bodies, both animal and vegetable, undergo spontaneous decomposition, when the vital principle is extinct. A knowledge of the affinities and habitudes of chemical bodies simple and compound, imparts to its possessor an irresistible power over the unions and disunions of the elements, which he can exercise with certainty in effecting innumerable transformations in the arts. 2.† A second composition.

DECOMPOSI''TION OF FORCES, *n.* In *mech.*, the same as the *resolution of forces.* Any force whatever may be decomposed or resolved into several others, the resultant of which is equal to the given force. DEFINI''TION, *n.* [Lat. *definitio*. *See* DEFINE.] 1. A brief description of a thing by its properties; as, a *definition* of wit, or of a circle.—2. In *logic*, the explication of the essence of a thing by its genus, or kind, and difference; an expression which explains any term or thing so as to distinguish or separate it from every thing else, as a boundary separates fields, the Latin term *definitio* literally signifying the laying down of a boundary. By the schoolmen, definitions are divided into *nominal* and *real*, according to the objects accomplished by them. A *nominal definition* explains the meaning of a term by some equivalent word or expression supposed to be better known. A *real definition* explains the nature of the thing. A *real definition* is again *accidental*, or a description of the accidents, as causes, properties, effects, &c.; or *essential*, which explains the constituent parts of the essence or nature of the thing. An *essential definition* is, moreover, *metaphysical* or *logical*, defining the genus and difference; as, for example, "*a plant is an organized being, destitute of sensation,*" where the first part of the expression denotes the genus, and the latter the difference; or *physical*, when it distinguishes the physical parts of the essence; thus a plant is distinguished by the leaves, stalk, root, &c. "A man" is defined *nominally* by the derivation of *homo*, man, from *humo*, the ground; *accidentally*, "a biped without wings;" *logically*, "a rational animal;" *physically*, "a natural being consisting of body and soul." The special rules for a good definition are, 1. It must be adequate, that is, it must agree to all the particular species or individuals included under the same idea. 2. It must be proper, and peculiar to the thing defined. 3. A definition should be clear and plain; no word should be used which has any difficulty in it. 4. It should be short, without tautology or superfluous words. 5. Neither the thing defined nor a synonymous name should make any part of the definition. A strictly accurate definition can be given of only a few objects. The most simple things are the least capable of definition, from the difficulty of finding terms more simple and intelligible than the one to be defined. Every large dictionary abounds with definitions which explain nothing, since the thing defined cannot be made clearer by any definition.—3. In *lexicography*, an explanation of the signification of a word or term, or of what a word is understood to express.

DEFIN'ITIVE, *a.* [Lat. *definitivus.*] 1. Limiting the extent; determinate; positive; express; as, a *definitive* term.—2. Limiting; ending; determining; final; opposed to *conditional*, *provisional*, or *interlocutory;* as, a *definitive* sentence or decree.

DEFIN'ITIVE, *n.* In *grammar*, an adjective used to define or limit the ex-

tent of the signification of an appellative or common noun. Such are the Greek ὁ, ἡ, το: the Latin *hic, ille, ipse*; *the, this*, and *that*, in English; *le, la, les*, in French; *il, la, lo*, in Italian. Thus, *tree* is an appellative or common noun; *the* tree, *this* tree, *that* tree, designate a particular tree, determinate or known. *Homo* signifies man; *hic* homo, *ille* homo, a particular man, &c. But in some languages, the definitives have lost their original use, in a great degree; as in the Greek and French. Thus, "La force de la vertu," must be rendered in English, *the force of virtue*, not the force of *the* virtue. The first *la* is a definitive; the last has no definitive effect.

3. In *genealogy*, a certain distance or remove in the line of descent, determining the proximity of blood; as, a relation in the third or fourth *degree*. —4. Measure; extent. The light is intense to a *degree* that is intolerable. We suffer an extreme *degree* of heat or cold.—5. In *geom.*, a division of a circle, including a three hundred and sixtieth part of its circumference. Hence a *degree of latitude* is the 360th part of the earth's surface north or south of the equator, and a *degree of longitude*, the same part of the surface east or west of any given meridian. In *geom.*, the circumference of every circle is supposed to be divided into 360 equal parts, called degrees; degrees are marked by a small ° near the top of the last figure of the number which expresses them; thus, 45° is 45 degrees. The degree is subdivided into 60 equal parts, called minutes; and the minute is again subdivided into 60 equal parts, called seconds. Thus, 45° 12′ 20″, are 45 degrees, 12 minutes, and 20 seconds. The magnitude or quantity of angles is estimated in degrees and parts of a degree, because equal angles at the centre of a circle are subtended by equal arcs, and equal angles at the centres of different circles are subtended by similar arcs, or arcs containing the same number of degrees and parts of a degree. An angle is said to be so many degrees as are contained in the arc of any circle intercepted between the lines which contain the angle, the angular point being the centre of the circle. Thus, we say an angle of 90°, or of 45° 24′. It is also usual to say, that a star is elevated so many degrees above the horizon, or declines so many degrees from the equator; or such a town is situated in so many degrees of latitude or longitude. The length of a degree depends upon the radius of the circle, of the circumference of which it is a part, the length being greater the greater the length of the radius. Hence, the length of a degree of longitude is greatest at the equator, and diminishes continually towards the poles. Under the equator, a degree of longitude contains 60 geographical, and 69½ statute miles. The degrees of latitude are found to increase in length from the equator to the poles, owing to the figure of the earth. *Degree* in *alge.*, is a term applied to equations, to distinguish the highest power of the unknown quantity. Thus, if the index of the highest power of the unknown quantity be 3 or 4, the equation is respectivelyof the 3rd or 4th degree.—6. In *music*, an interval of sound, marked by a line on the scale.—7. In *arith.*, a degree consists of three figures; thus, 270, 360, compose two degrees.—8. A division, space, or interval, marked on a mathematical or other instrument; as, on a thermometer or barometer.—9. In *colleges* and *universities*, a mark of distinction conferred on students, as a testimony of their proficiency in arts and sciences; giving them a kind of rank, and entitling them to certain privileges. This is usually evidenced by a diploma. Degrees are conferred *pro meritis* on the alumni of a college; or they are honorary tokens of respect, conferred on strangers of distinguished reputation. The *first degree* is that of *Bachelor of Arts; the second*, that of *Master of Arts.* In *Germany*, the next degree is Doctor of Philosophy, which is understood to comprehend both Bachelor of Arts and Master of Arts. Honorary degrees are those of *Doctor of Divinity, Doctor of Laws*, &c. Physicians also receive the degree of *Doctor of Medicine.*—*By degrees*, step by step; gradually; by little and little; by moderate advances. DE'MON, *n.* [L. *dæmon*; Gr. δαιμων: Fr. *démon*; Ir. *deamal* or *deamon*. The origin and primary sense of this word are by no means easy to ascertain. Qu. Ar. *dahima, daima*, to fall suddenly, to rush, to overwhelm, to obscure, to blacken; whence misfortune, black, blackness, evil, a monster; or is it a compound of *dea, dia, deus* and *mon*, a word signifying evil, from the Persian? I place little confidence in these conjectures.] A spirit, or immaterial being, holding a middle place between men and the celestial deities of the Pagans. The ancients believed that there were good and evil demons, which had influence over the minds of men, and that these beings carried on an intercourse between men and gods, conveying the addresses of men to the gods, and divine benefits to men. Hence demons became the objects of worship. It was supposed also that human spirits, after their departure from the body, became demons, and that the souls of virtuous men, if highly purified, were exalted from demons into gods. In *the Scriptures*, the Greek δαιμων is rendered *devil*, and sometimes at least improperly; for nothing is more certain than that different beings are intended by διαβολος and δαιμων. The demons of the New Testament were supposed to be spiritual beings which vexed and tormented men. And in general, the word, in modern use, signifies an evil spirit or genius, which influences the conduct or directs the fortunes of mankind. [*See* Campbell's Dissert.]

If a body of equal bulk with another is of double the density, it contains double the quantity of matter. Or if a body contain the same quantity of matter as another, but under a less bulk, its density is greater in proportion as its bulk is less than that of the other. Hence, the density is directly proportional to the quantity of matter, and inversely proportional to the bulk or magnitude. The relative quantities of matter in bodies are known by their gravity or weight, and when a body, mass, or quantity of matter is spoken of, its weight, or gravity is always understood, that being the proper measure of the density, or quantity of matter. The weights of different bodies, of equal bulks, indicate their relative densities. No body is absolutely or perfectly dense; that is, no space is perfectly full of matter, so as to have no vacuity or interstices in it; in other words there is no body free from pores.—2. We probably see its affinities in Sp. *pison*, a rammer, and the L. *piso*, to stamp, whence *pistillum*, Eng. *pestle, piston*, &c. DEW, *n.* [Sax. *deaw;* G. *thau.* It is probably from the same primary root as *thaw;* G. *thau*, dew, *thauen*, to thaw.] The aqueous vapour or moisture which is deposited from the air, in the form of minute globules, on the surfaces of bodies during the night. This happens when the surface of the ground is colder than the lower strata of the atmosphere. Dew is vapour condensed on the surface of bodies; it does not fall like rain and rest there, but its existence depends entirely on the power which the surface has of becoming sufficiently reduced in temperature to effect the condensation. Dew appears chiefly on calm and clear nights. It is never seen on nights both cloudy and windy. It is much more copiously deposited on some surfaces than on others. In winter, dew becomes hoar-frost.

DEW′-POINT, *n.* The degree indicated by the thermometer when dew begins to be deposited. It varies with the degree of the humidity of the atmosphere. The more humid the atmosphere, the less the difference between its temperature and that of the dew-point, and *vice versa.* When the air is saturated with moisture and any colder body brought into contact with it, deposition of moisture or dew immediately takes place on its surface. As we ascend into the atmosphere, the dew-point remains stationary to great heights, and then falls suddenly to a large amount.

A reverse or *sinistral* shell, when placed in a perpendicular position, has its spiral volutions in an opposite direction to the motion of the index of a clock, and resembles what is called a sinistral or left-handed screw. It is a good substitute for gum arabic in medicine.

Thirst and a voracious appetite are its first symptoms; the urine gradually increases in quantity; and then there is a sense of weight and uneasiness in the loins, emaciation, œdematous legs, and hectic fever. There are very few cases on record of the cure, or even of the relief of confirmed diabetes.

The line on which this plane is erected, is called the *substile;* and the angle included between the *substile* and *stile,* is called the elevation or height of the stile. A dial may be horizontal, vertical, or inclining. Before the invention of clocks and watches, dials were generally to be seen in most places of public resort, as churches, crossways, markets, &c. A dialect is the branch of a parent language, with such local alterations as time, accident, and revolutions may have introduced among descendants of the same stock or family, living in separate or remote situations. But in regard to a large portion of words, many languages which are considered as distinct, are really dialects of one common language.—2. Language; speech, or manner of speaking.

Whenever any point of a figure is called a centre, any straight line drawn through the centre, and terminated by opposite boundaries is called a *diameter.* And any point which bisects all lines drawn through it from opposite boundaries is called a centre. Thus, the circle, the

A mineral, gem, or precious stone, of the most valuable kind, remarkable for its hardness, as it scratches all other minerals. When pure, the diamond is usually clear and transparent, but it is sometimes coloured. In its rough state, it is commonly in the form of a roundish pebble, or of octahedral crystals. It consists of pure carbon, and when heated to 14° Wedgwood, and exposed to a current of air, it is gradually, but completely combustible. When pure and transparent, it is said to be of the first water. The weight, and consequently the value of diamonds, is estimated in carats, one of which is equal to four grains; and the price of one diamond compared to that of another of equal colour, transparency, purity, form, &c., is as the squares of the respective weights estimated in carats. Thus, a diamond of two carats is worth four times as much as one of one carat, both being of the same quality. Diamonds are valuable for many purposes. Their powder is the best for the lapidary and the gem engraver. Glaziers cut glass with them; and glass cutters, looking-glasses, and other articles of window and plate-glass. 2. Two glass tubes, each terminating in a hollow ball, and having their bores somewhat widened at the other ends, a small portion of sulphuric acid tinged with carmine being introduced into the ball of one, are joined together by the flame of a blow-pipe, and afterwards bent into nearly the shape of the letter U. To one of the legs of the thermometer a scale is attached; and the liquid contained in the tube is so disposed that it stands in the graduated leg opposite the zero of the scale, when both balls are exposed to the same temperature so that the instrument is affected only by the difference of heat of the two balls. As long as both balls are of the same temperature, the coloured liquid remains stationary; but if, for instance, the ball which holds a portion of the liquid be warmer than the other, the superior elasticity of the confined air will drive it forwards and make it rise in the opposite branch above the zero, to an elevation proportional to the excess of elasticity, or of heat.

The gastric juice is found to contain a small quantity of a matter derived from the living membrane of the stomach, which is in a state of progressive change, and the change or motion is propagated from this to the particles of the food under certain conditions, such as a certain temperature, &c. The oxygen introduced with the saliva, during mastication, assists in the process. A good *digestion* is essential to health.—2. The largest species hitherto discovered (*D. giganteum*,) is calculated to have attained the length of eighteen feet. It had a proboscis and two tusks placed at the anterior extremity of the lower jaw, and curved downwards somewhat after the manner of those in the upper jaw of the walrus. It seems to have been destined to live in water, its tusks having been used as instruments for raking and grubbing up large aquatic vegetables from the bottom. The tusks may have also been applied to hook on the head of the animal to the bank, so as to allow it to breathe securely during sleep, while the rest of the body remained floating. We use *distend* chiefly to denote the stretching, spreading, or expansion of any thing, by means of a substance inclosed within it, or by the elastic force of something inclosed. In this case the body distended swells or spreads in all directions, and usually in a spherical form. A bladder is *distended* by inflation, or by the expansion of rarefied air within it. DISTILLA'TION, *n.* The act of falling in drops, or the act of pouring or throwing down in drops.—2. The vaporization and subsequent condensation of a liquid by means of an alembic, or still and refrigeratory, or of a retort and receiver; the operation of extracting spirit from a substance by evaporation and condensation; rectification. In the commercial language of this country, distillation means the manufacture of intoxicating spirits, under which are comprehended the four processes of *mashing* the vegetable materials, *cooling* the worts, exciting the *vinous fermentation*, and separating, by a peculiar vessel, called a still, the alcohol, combined with more or less water. The most common method of conducting the process of distillation, consists in placing the liquid to be distilled in a copper vessel, called the still, having a movable head with a swan-like neck, which is so formed as to fit a coiled tube, packed away in a tub of water, constantly kept cold, and which is termed a *refrigeratory*. The fire is applied either immediately to the still, or mediately by means of a water or sand bath. The liquid to be obtained rises, in vapour, into the head of the still, and passing down the curved tube or worm, becomes condensed, by the cold water, and makes its exit in a liquid state. This liquid consists of alcohol mixed with a large portion of water. It then undergoes the process of *rectification*, in which the spirit is concentrated and purified principally by means of re-distillation. *Distillation* is of great importance, not only in obtaining spirituous liquors, but also in procuring essences, essential oils, &c. In *practical chemistry*, it is indispensably necessary.—*Destructive distillation*, the decomposition of bodies by a strong heat in one vessel, and the collection of the products in another.—3. The primary sense is, to prick, to pierce with a sharp point, to thrust in or on; and we retain the precise word in the verb to *stick*, which see. treasure from sunken vessels, &c. Diving-bells have been made of various forms, such as that of a bell, a hollow truncated cone, or pyramid, with the smaller end close, and the larger one, which is placed lowermost, open. The air contained within these vessels prevents them from being filled with water on submersion, so that the diver may descend in them and breathe freely for a long time, provided he can be furnished with a new supply of fresh

air, when the contained air becomes vitiated by respiration. The diving-bell is now generally made of cast iron in the form of an oblong chest (*a*) open at the bottom. It has several strong convex lenses set in the upper side or roof of the bell, to admit light to the persons within. It is suspended by chains from two lighters, and can be raised or lowered at pleasure upon signals being given by the persons within, who are supplied with fresh air injected into a flexible pipe by means of forcing pumps (*b*) placed in the lighters, while the heated air escapes by a cock in the upper part of the bell. There is also an apparatus for enabling a person to quit the bell, and remove to a considerable distance when requisite.

DIVISIBIL'ITY, *n.* [Fr. *divisibilité;* from L. *divisibilis.* See DIVIDE.] The quality of being divisible; that general property of bodies by which their parts or component particles are capable of separation. All bodies which possess sensible extension may be divided into several parts, and these again may be subdivided into particles more or less small, and so on to an extreme degree of minuteness; but whether or not bodies are infinitely divisible is a question which, owing to the imperfection of our senses, cannot be determined. Numerous examples of the division of matter to a degree almost exceeding belief, may be found in experimental inquiries in physical science; the useful arts furnish many not less striking; but perhaps the most conspicuous proofs of the extreme minuteness of which the parts of matter are susceptible, are to be found in the organized world.

DIVIS'IBLE, *a.* (*s* as *z.*) [L. *divisibilis*, from *divido.* See DIVIDE.] Capable of division; that may be separated or disunited; separable. Matter is *divisible* indefinitely.

In *logic*, the enumeration of several things signified by a common name; thus, tree is said to be divided into oak, ash, elm, &c. A common term may be divided in several ways, according to the various points of view in which it may be regarded for the purpose of qualification. In *England*, there are two kinds of legal separation between man and wife, called *divorces.* These are, first, that *à mensa et thoro* (more correctly designated *separation* "from bed and board"), and pronounced, after due inquiry, by the spiritual courts. Secondly, *divorce à vinculo matrimonii;* which can alone be done by a special act of parliament for each case. This last is a really complete divorce, as only by its means can parties set free from "the marriage chain" legally marry again. *Divorces* in *England* are based on pleas of too close relationship, idiocy, adultery, cruelty, &c. In *Scotland*, the grounds for *divorce* are the same, with the added plea of *desertion;* and the jurisdiction in divorce cases, by act Wm. IV., c. 69, was given to the Court of Session.—2. transitive, is formed in the indicative, present tense, thus: I *do*, thou *doest*, he *does* or *doth*; when auxiliary, the second person is, thou *dost*. [Sax. *don;* G. *thun;* Goth. *tauyan*. This is probably a contracted word, for in Saxon *dohte* signifies *made* or *did*, as if the pret. of this verb. DOCK, *n.* [Sax. *docce;* L. *daucus;* Gr. δαυκος: from Ar. Syr.] The common name of many perennial tap-rooted species of the genus Rumex. They do not multiply by division of the roots; but the seeds are dispersed in such abundance that they become a serious nuisance in cultivated lands if they are not extirpated. Including the different sorts of sorrel, there are about a dozen species of Rumex in Britain; the large leaved are called docks, and the small leaved sorrels. Class Hexandria, order trigynia, nat. order Polygonaceæ.—2. The tail of a beast cut short or clipped; the stump of a tail; the solid part of the tail.—3. A case of leather to cover a horse's dock.—4. A place artificially formed on the side of a harbour or the bank of a river for the reception of ships, the entrance of which is generally closed by gates. In *America*, the spaces between wharves are called *docks*. There are two kinds of docks, *dry-docks* and *wet-docks*. The former are used for receiving ships in order to their being inspected and repaired. For this purpose the dock must be so contrived that the water may be admitted or excluded at pleasure, so that a vessel can be floated in when the tide is high, and that the water may run out with the fall of the tide, or be pumped out, the closing of the gates preventing its return. *Wet-docks* are formed for the purpose of keeping vessels always afloat. The name of *dock* has sometimes been applied to an excavation, from which the water, or a considerable part of it runs in and out with the tide, but such an excavation is more properly an artificial basin or harbour than a dock. One of the chief uses of a dock is to keep a uniform level of water, so that the business of loading and unloading ships can be carried on without any interruption.

In Scotch, the word signifies a paper kite, as also in Danish; probably from the notion of flying or shooting along, like a fiery meteor. In Welsh, *draig* is rendered by Owen a procreator or generating principle, a fiery serpent, a dragon, and the Supreme; and the plural *dreigiau*, silent lightnings, *dreigiaw*, to lighten silently. DYNAM'ICS, *n.* [Gr. δυναμις, force or power.] Literally, the doctrine of force or power; but as force or power is known to us in no other way than by its effect, that is, by the *motion* which it produces in the body on which it acts, and is measured by that motion, *dynamics* may be defined to be the science which treats of the motion of bodies. It is, however, usually restricted to those circumstances of motion in which the moving bodies are at liberty to obey the impulses communicated to them; the opposite cases, or those in which the bodies, whether by external circumstances, or by their connection with one another, are not at liberty to obey the impulses given, being comprehended in the science of *mechanics*. Thus the motion of a stone falling freely to the ground, or of a celestial body in its orbit, belongs to dynamics; while that of a body descending an inclined plane would properly belong to mechanics. Some writers, however, define dynamics to be that division of the science of mechanics, which considers bodies as acted upon by forces which are not *in equilibrium;* that branch of the science which considers bodies as influenced by forces that are in equilibrium being termed *statics*.

E

E, the second vowel and the fifth letter of the English alphabet, seems to be the ancient Phœnician and Hebrew ה inverted, corresponding nearly with the Chaldaic and later Hebrew ה. Its long and natural sound in English coincides with the sound of *i* in the Italian and French languages, and is formed by a narrower opening of the glottis than that of *a*. It has a long sound, as in *here, mere, me;* a short sound, as in *met, men;* and the sound of *a* open or long, in *there, prey, vein*. As a final letter, it is generally quiescent; but it serves to lengthen the sound of the preceding vowel, or at least to indicate that the preceding vowel is to have its long sound, as in *mane, cane, plume*, which, without the final *e*, would be pronounced *man, can, plum*. After *c* and *g*, the final *e* serves to indicate that *c* is to be pronounced as *s*, and *g* as *j*. Thus without the final *e*, in *mace* [mase,] this word would be pronounced *mac* [mak,] and *rage* [raj] would be pronounced *rag*. In a numerous class of words, indeed in almost every word, except a few from the Greek, the final *e* is silent, serving no purpose whatever, unless to show from what language we have received the words, and in many cases it does not answer this purpose. In words ending in *ive*, as *active;* in *ile*, as *futile;* in *ine*, as in *sanguine, examine;* in *ite*, as in *definite;* *e* is, for the most part, silent. In some of these words, the use of *e* is borrowed from the French; in most or all cases, it is not authorized by the Latin originals; it is worse than useless, as it leads to a wrong pronunciation; and the retaining of it in such words is, beyond measure, absurd. When two of this vowel occur together, the sound is the same as that of

the single *e* long, as in *deem, esteem, need;* and it occurs often with *a* and *i*, as in *mean, hear, siege, deceive*, in which cases, when one vowel only has a sound, the combination I call a digraph [*double written*.] In these combinations, the sound is usually that of *e* long, but sometimes the short sound of *ĕ*, as in *lĕad*, a metal, *rĕad*, pret. of *rēad*, and sometimes the sound of *a* long, as in *reign, feign*, pronounced *rane, fane*. Irregularities of this kind are not reducible to rules. As a numeral, E stands for 250. In the calendar, it is the fifth of the dominical letters. As an abbreviation, it stands for *East*, as in charts; E. by S., East by South. It is often placed with *g* as a contraction, [as *e. g., exempli gratia*,] to signify, for example. It is also placed after *i*, [as *i. e., id est*,] to signify, that is. E, in *music*, is the third note or degree of the diatonic scale, answering to the *mi* of the Italians and French.

E. A prefix, the same as *ex*, signifying from or out of, and in many words having a privative meaning.

EACH, *a.* [Scot. *eik*. This word is either a contraction of the Sax. *ælc, elc*, D. *elk*, or the Ir. *ceach*, or *gach*, Basque *gucia*, Fr. *chaque*, with the loss of the first articulation. With the Celtic corresponds the Russ. *kajdei*, each. Some etymologists believe both the English and Scotch words to be contractions of the Celtic *ceuch*.] Every one of any number separately considered or treated. The emperor distributed to *each* soldier in his army a liberal donative.

To all of them he gave *each* man changes of raiment; Gen. xlv.

And the princes of Israel, being twelve men, *each* one was for the house of his fathers; Num. i.

Simeon and Levi took *each* man his sword; Gen. xxxiv.

and the tongue is cloven or bifid. There are several species, as the bald or white-headed eagle, the sea-eagle or ossifrage, the golden eagle, &c. The eagle is one of the largest species of fowls, has a keen sight, and preys on small animals, fish, &c. He lives to a great age; and it is said that one died at Vienna, after a confinement of a hundred and four years. On account of the elevation and rapidity of his flight, and of his great strength, he is called the king of birds. Hence the figure of an eagle was made the standard of the Romans, and a spread eagle is a principal figure in the arms of the United States of America. Hence also, in *her.*, it is one of the most noble bearings in armoury. —2. A gold coin of the United States, of the value of ten dollars, or forty-two shillings sterling.—3. These nodules often embrace at the centre a kernel or nucleus, sometimes movable, and always differing from the exterior in colour, density, and fracture. To these hollow nodules the ancients gave the name of *eagle-stones*, from an opinion that the eagle transported them to her nest to facilitate the laying of her eggs.

EARL, *n.* (erl.) [Sax. *eorl;* Ir. *iarla,* an earl; *earlamh,* noble. This word is said to have been received from the Danes, although not now used in Denmark. Formerly this title among the Danes was equivalent to the English *alderman.*] A British title of nobility, or a nobleman, the third in rank, being next below a marquis, and next above a viscount. The title answers to *count* [*comte*] in France, and *graf* in Germany. The earl formerly had the government of a *shire,* and was called *shireman.* After the Conquest, earls were called counts, and from them shires have taken the name of *counties.* —*Earl* is now a mere title, unconnected with territorial jurisdiction. An *earl's coronet* consists of a richly chased circle of gold, having on its edge eight strawberry leaves, and between each pair a pearl raised on a spire higher than the leaves, cap, &c., as in a duke's coronet.

[*See* EARLY and ERE.] A state of advance or forwardness; a state of being before any thing, or at the beginning; as, the *earliness* of rising in the morning is a rising at the dawn of the morning, or before the usual time of rising. So we speak of the *earliness* of spring, or the *earliness* of plants, to express a state somewhat in advance of the usual time of spring, or growth of plants.

EARLY, *a.* (er'ly.) [From Sax. *ær, er,* before, in time, Eng. *ere* which indicates the root of the word to signify, to advance, to pass along or shoot up. It is probably connected with the D. *eer,* G. *ehre,* Sw. *ähra,* Dan. *ære,* honour, denoting the highest point.] 1. In advance of something else; prior in time; forward; as *early* fruit, that is, fruit that comes to maturity before other fruit; *early* growth; *early* manhood; *early* old age or decrepitude, that is, premature old age. So an *early* spring; an *early* harvest.—2. First; being at the beginning; as *early* dawn. —3. Being in good season; as, the court met at an *early* hour.

EARLY, *adv.* (er'ly.) Soon; in good season; betimes; as, rise *early;* come *early;* begin *early* to instil into children principles of piety.

EARN, *v. t.* (ern.) [Sax. *ear iun, ærnian, gearnian,* to earn, to merit. It is connected in origin with *earnest* and *yearn*—which see. The primary sense is to strive or urge, implying an effort to advance or stretch forward.] 1. To merit or deserve by labour, or by any performance; to do that which entitles to a reward, whether the reward is received or not. Men often *earn* money or honour which they never receive. *Earn* money before you spend it, and spend less than you *earn.*—2. EARNED, *pp.* (ern'ed.) Merited by labour or performance; gained.

EARNEST, *a.* (ern'est.) [Sax. *eornest,* or *geornest,* from *georn,* desirous, studious, diligent, assiduous, whence *geornian, gyrnan,* to desire, to *yearn;* Dan. *gierne,* willingly, freely, gladly, cheerfully; *gierning,* a deed, act, exploit; Ger. *ernst;* W. *ern,* earnest-money. The radical sense is, to strive to advance, to reach forward, to urge, to strain.] 1. Ardent in the pursuit of an object; eager to obtain; having a longing desire; warmly engaged or incited.

> They are never more *earnest* to disturb us, than when they see us most *earnest* in this duty. *Duppa.*

2. Ardent; warm; eager; zealous; animated; importunate; as, *earnest* in love; *earnest* in prayer.—3. Intent; fixed.

> On that prospect strange
> Their *earnest* eyes were fixed. *Milton.*

4. Serious; important; that is, really intent or engaged; whence the phrase, *in earnest.* To *be in earnest,* is to be really urging or stretching toward an object; intent on a pursuit. Hence, from fixed attention, comes the sense of *seriousness* in the pursuit, as opposed to trifling or jest. Are you *in earnest* or *in jest?*

EARNEST, *n.* (ern'est.) Seriousness; a reality; a real event; as opposed to jesting or feigned appearance.

> Take heed that this jest do not one day turn to *earnest.* *Sidney.*
> And give *in earnest* what I begg'd in jest. *Shak.*

2. First-fruits; that which is in advance, and gives promise of something to come Early fruit may be an *earnest* of fruit to follow. The first success in arms may be an *earnest* of future success. The Christian's peace of mind in this life is an *earnest* of future peace and happiness. Hence, *earnest* or *earnest-money* is a first payment or deposit giving promise or assurance of full payment. Hence the practice of giving an *earnest* to ratify a bargain.—In the *law of Scotland,* earnest is held merely as evidence of the completion of the contract; and the party who resiles, besides losing the earnest he has paid, may be compelled to perform his obligation. In ordinary cases the earnest paid is trifling in value, and is not taken into account in the reckoning. This sense of the word is primary, denoting that which goes before, or in advance. Thus, the *earnest* of the Spirit is given to saints, as a pledge or assurance of their future enjoyment of God's presence and favour.

EARNESTLY, *adv.* (ern'estly.) Warmly; zealously; importunately; eagerly; with real desire.

> Being in an agony, he prayed more *earnestly;* Luke xxii.

> A certain maid looked *earnestly* upon him; Luke xxii.

EARTH, *n.* (erth.) [Sax. *eard, eorth, yrth;* G. *erde;* Scot. *erd, yerd, yird, yerth;* Tartaric, *yirda.* It coincides with the Heb. ארץ, *eretz.* The Ar. *aratza,* from which the Arabic and Hebrew words corresponding to the Teutonic above, are derived, signifies to eat, gnaw, or corrode as a worm, or the teredo. It is obvious then that the primary sense of *earth* is fine particles, like *mould.* The verb may be from רצץ, *ratzatz,* to break or bruise. The Ch. and Syr. ארעא, *areha,* earth, may be contracted from the same word. *See* Corrode.] 1. Earth, in its primary sense, signifies the particles which compose the mass of the globe, but more particularly the particles which form the fine mould on the surface of the globe; or it denotes any indefinite mass or portion of that matter. We throw up *earth* with a spade or plough; we fill a pit or ditch with *earth;* we form a rampart with *earth.* This substance being considered, by ancient philosophers, as simple, was called an element; and in popular language, we still hear of the four elements, *fire, air, earth,* and *water.*—2. In *chem.*, the term earth was, till lately, employed to denote a supposed simple elementary body or substance, defined to be tasteless, inodorous, uninflammable and infusible. But it has also been applied to substances which have a very sensible alkaline taste, as lime. The primitive earths were reckoned ten in number, viz. *silex, alumine, lime, magnesia, baryta, strontia, zircon, glucina, yttria,* and *thorina.* Recent experiments prove that all of them are compounds of oxygen with metallic bases. The earths are now to be considered as metallic oxides. Almost the whole surface of the globe is composed of the three earths, silica, or silex, alumine, and lime, combined in an infinite diversity of forms.—3. The terraqueous globe which we inhabit. It is reckoned, in *astr.*, one of the planets, and is the third in order from the sun, its orbit embracing those of Mercury and Venus, but being within the orbits of all the other planets. The earth is endowed with a double motion; first a motion round its axis, from west to east, in 24 hours; and secondly, a motion of revolution round the sun. It is the first of these motions which produces the phenomena of day and night, and the apparent diurnal revolution of the heavenly bodies. The time in which the earth's rotation is performed is measured by the interval which elapses, between two transits of the same fixed star over the meridian of any place, and this interval is always precisely the same. It is called a *sidereal* day, and forms a perfectly uniform measure of time. The revolution of the earth about the sun is performed in an elliptic orbit, having the sun in one of the foci, and its mean distance from the sun is nearly 95 millions of miles. The time in which the earth performs a revolution in its orbit with respect to the fixed stars, is 365 days, 6 hours, 9 minutes, 9.6 seconds. This is called the *sidereal* year. [*See* Year.] The plane which contains the earth's orbit is called the *ecliptic.* The earth's axis is inclined to this plane in an angle of 66°, 32′, 4″, whence the earth's *equator* is inclined to the ecliptic in an angle of 23°, 27′, 56″. This inclination, which is called *the obliquity of the ecliptic,* gives rise to the phenomena of the seasons. The figure of the earth is that of an oblate spheroid of revolution, the polar axis being to the equatorial diameter in the ratio of 301 to 302. The equatorial diameter is nearly 7925 English miles, the polar diameter about 7898 miles, and the mean diameter, 7912 miles. Two-thirds of the earth's surface are covered with water; its mass compared with that of the sun is nearly as 1 to 355,000; its mean density is to that of water as 5. to 1.—4. The tuber or nut is found about four or six inches below the surface, at the termination of a long slender root. It is about the size of a chestnut, of a sweetish farinaceous nature, resembling in taste the common chestnut. Swine are very fond of them, and fatten rapidly where they are procured in abundance. The same name is given in Egypt to the round tuber of *Cyperus rotundus,* and other species of the same genus; in China, to the subterranean pods of *Arachis hypogæa,* a leguminous plant; and in other countries to similar pods; produced by various plants.

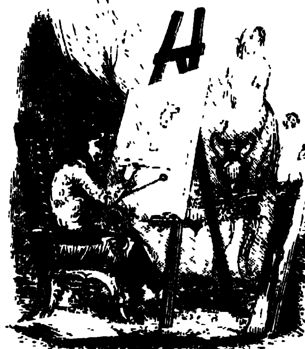
EARTH′QUAKE, *n.* A shaking, trembling or concussion of the earth; sometimes a slight tremor; at other times a violent shaking or convulsion; at other times a rocking or heaving of the earth. Earthquakes are usually preceded by a general stillness in the air, and an unnatural agitation of the waters of the ocean and of lakes. The shock comes on with a deep rumbling noise like that of a carriage over a rough pavement, or with a tremendous explosion resembling the discharge of artillery, or the bursting of a thunder cloud; and sometimes heaves the ground perpendicularly upwards, and sometimes rolls it from side to side. The single shocks of an earthquake seldom last more than a minute, but they frequently follow one another at short intervals for a considerable length of time. During these shocks, large chasms are made in the ground, from which sometimes smoke and flames, but more frequently stones and torrents of water, are discharged. In violent earthquakes, these chasms are sometimes so extensive as to overwhelm whole cities at once. In consequence of these shocks, also, whole islands are frequently sunk, and new ones raised; the course of rivers is changed, and seas overflow the land. All observations go to prove that earthquakes arise from certain powers operating within the crust of the earth. The phenomena of earthquakes bear so close an affinity to those of volcanoes, that both without doubt pro-



ceed from the same causes. [*See* VOLCANO.]

This is occasioned by the light of the enlightened part of the earth, which, falling upon the moon's disk, is reflected back to the earth.

ECH'O, *n.* [L. *echo*; Gr. ἠχώ, from ἦχος, sound, ἠχέω, to sound.] 1. A sound reflected or reverberated from a solid body; sound returned; repercussion of sound; as, an *echo* from a distant hill.

The sound must seem an *echo* to the sense. *Pope.*

When sound in its passage through the air meets an obstacle, the particles of air in vibration are reflected in the

same manner as elastic bodies, and communicate to the contiguous particles a vibratory motion, which is propagated in the direction determined by the inclination of the opposing surface to the original direction in which the sound reaches it, the angle of incidence being always equal to the angle of reflection. If the direct and reflected sounds succeed each other with great rapidity, which happens when the reflected surface is near, they are in some measure confounded, and the echo cannot be distinguished. Sound passes through the atmosphere at the rate of about 1125 feet in a second; hence a person placed at half that distance, or 512 feet from the reflecting surface, would hear the echo exactly one second after the sound was emitted by him, and the echo would repeat as many distinct sounds as the ear can distinguish in a second, which is about ten; hence no distinct echo can be produced if the reflecting surface is nearer than 50 feet. The wall of a house or the rampart of a city, a wood, rocks, mountains, valleys, produce echoes. Some echoes are remarkable for their frequency of repetition. The most celebrated echoes of this kind exist at St. Goar on the Rhine, Woodstock-park in England, the Lakes of Killarney in Ireland, and the Villa Vimourtia, near Milan.—2. The number of eclipses of the sun and moon cannot be fewer than two, nor more than seven in one year. The most usual number is four, and it is rare to have more than six. The ecliptic is the apparent path of the sun, but as in reality it is the earth which moves, the ecliptic is the path or way among the fixed stars which the earth in its orbit appears to describe, to an eye placed in the sun. The angle of inclination of the equator and ecliptic, is called the obliquity of the ecliptic. Education comprehends all that series of instruction and discipline which is intended to enlighten the understanding, correct the temper, and form the manners and habits of youth, and fit them for usefulness in their future stations. In its most extended signification it may be defined, in reference to man, to be the art of developing and cultivating the various physical, intellectual, and moral faculties; and may thence be divided into three branches—physical, intellectual, and moral education. This definition is by no means complete; but it is used merely as indicative of the manner in which this subject has generally been discussed. Under physical education, is included all that relates to the organs of sensation and the muscular and nervous system. Intellectual education comprehends the means by which the powers of the understanding are to be developed and improved, and a view of the various branches of knowledge which form the objects of instruction of the three departments above stated. Moral education embraces the various methods of cultivating and regulating the affections of the heart. Religious education, although intimately connected with moral education, may be considered as a distinct branch, and the most important of all. To give children a good *education* in manners, arts, and science, is important; to give them a religious *education* is indispensable; and an immense responsibility rests on parents and guardians who neglect these duties.

In winter, they lie buried in mud, being very impatient of cold. They grow to the weight of 15 or 20 pounds; and the conger eel is said to grow to a hundred pounds in weight, and to 10 feet in length. They are esteemed good food; but do not agree with all constitutions. The tenacity of life in the eel, after being flayed and mutilated, is very extraordinary. In butter much salted, the salt shoots in spiculæ, and an efflorescence is often seen on walls formed with plaster. In some species of salts, as in sulphate and carbonate of soda, the efflorescence consists of fine white dust. This kind of efflorescence is the contrary of deliquescence. In the latter, the saline crystals decompose the air, or rather abstract moisture from it; in the former, the atmosphere decomposes the saline crystals, and the water of crystallization is abstracted from the salts.

ELECTRI''CIAN, *n.* One who studies electricity, and investigates its properties, by observation and experiments; one versed in the science of electricity.

ELECTRIC'ITY, *n.* [*See* ELECTRIC.] The name given to the cause of a series of phenomena exhibited by various substances, and also to the phenomena themselves. We are totally ignorant of the nature of this cause; whether it be a material agent or merely a property of matter. But as some hypothesis is necessary for explaining the phenomena observed, it has been assumed to be a highly subtile imponderable fluid, identical with lightning, which pervades the pores of all bodies, and is capable of motion from one body to another. The first knowledge of electricity was due to the following out the observation made by Thales (B.C. 600) that amber, called by the Greeks ηλεκτρον, when rubbed acquired the property of attracting light substances. It was subsequently observed that glass and various other substances, when rubbed, acquired the same property. Thus if a tube of glass, a roll of sulphur, a piece of sealing-wax, or any resinous body, be rubbed with woollen cloth or silk, it immediately attracts light bodies, at a greater or less distance according to the strength of the electric virtue. The cause of this attraction is owing to *electricity*, excited by the friction, and the attraction itself is termed *electrical attraction.* It must be observed, however, that while some of the light substances adhere to the body which has been rubbed, or the *excited body*, as it is termed, others are repelled immediately after contact. After a while the excited body loses its influence, but it may again be renewed by friction; and if the body be sufficiently excited, and touched by the knuckle or a metallic ball, there is a slight crack, and a spark (called the *electric spark*) passes into the body presented to it. Bodies which, when rubbed or excited, exhibit the attractions and repulsions above mentioned, such as amber, resin, sulphur, glass, the precious stones, &c. are called *electrics*; and those bodies which cannot be excited by friction, such as the metals, charcoal, living animals, water, &c., are called *non-electrics.* The former class are also called *non-conductors*, because although they are capable of producing electricity, they do not allow it to pass easily through their substance; while the latter class are called *conductors*, because they readily transmit the electricity which they receive to any distance; and such is the rapidity of the electric fluid in motion that no perceptible length of time is required for its passage to any known distance. Electricity may be produced in various ways, but the simplest and most usual mode of producing it is by friction, and for this purpose electrical machines are employed. When a body acquires more than its natural quantity of electricity, it is said to be *positively electrified*, and when the natural quantity is diminished, the body is said to be *negatively electrified.* The electricity produced by glass, and that produced by resinous substances, are not identical; since each is found to attract what the other repels. Hence has arisen the theory of two distinct electricities; the one being called the *vitreous*, and the other the *resinous* electricity. The vitreous electricity is also sometimes called *positive*, and the resinous *negative* electricity, in consequence of theoretical views entertained on this subject. The fundamental laws of electricity are as follows:—Bodies in opposite states of electricity attract each other; bodies in similar states, that is, both positively or both negatively electrified, repel each other; and bodies in a natural state attract both those that are positively, and those that are negatively electrified. *Electricity*, when accumulated in large quantities, becomes an agent capable of producing the most sudden, violent, and destructive effects, as in thunder storms; and even in its quiescent state it is extensively concerned in the operations of nature. It is an important chemical agent, and its use has been lately much extended in the arts and manufactures. [*See* GALVANISM, VOLTAIC ELECTRICITY, LIGHTNING, &c. &c.]

ELEC'TROTYPE, *n.* [Gr. ἠλεκτρον and τυπος, figure, image, form.] A process of electro-metallurgy recently discovered, and applied for the purpose of obtaining in metal, perfect copies to any extent, of various sorts of sculpture, impressions of medals, coins, facsimiles of engraved plates, &c. This is accomplished by subjecting certain metallic solutions, chiefly sulphate of copper, to the action of a galvanic battery, by which means a decomposition takes place, and the metal in its pure state is deposited in a film of the required thickness upon the surface, from which a copy or impression is to be taken. The metallic film thus deposited can be separated from the surface of the object, when it will be found to present a faithful and minute copy or impression of that object. The object to be copied must be of metal, or have a metallic surface given to it. Gold, silver, and other metals may be substituted for copper; and if the precipitated metal be left upon the surface upon which it is thrown down, gilding, silvering, and coppering may be extensively and beautifully effected. The object upon which a deposit of metal is to be made must be immersed in the fluid holding any particular metal in solution, and connected by a wire to the negative pole of a galvanic battery, while the galvanic circuit is completed by immersing a similar piece of metal to that held in solution, and joining it by a wire to the zinc pole of the battery.

EL'EGANCE, } *n.* [L. *elegantia*; Fr.
EL'EGANCY, } *élégance*; probably from L. *eligo*, to choose, though irregularly formed.] In its primary sense, this word signifies that which is choice or select, as distinguished from what is common. 1. "The beauty of propriety, not of greatness," says Johnson. *Applied to manners or behaviour*, elegance is that fine polish, politeness, or grace, which is acquired by a genteel education, and an association with well-bred company. *Applied to language*, elegance respects the manner of speaking or of writing.—*Elegance of speaking* is the propriety of diction and utterance, and the gracefulness of action or gesture; comprehending correct, appropriate, and rich expressions, delivered in an agreeable manner.—*Elegance of composition* consists in correct, appropriate, and rich expressions, or well-chosen words, arranged in a happy manner. Elegance implies neatness, purity, and correct, perspicuous arrangement, and is calculated to please a delicate taste, rather than to excite admiration or strong feeling. Elegance is applied also to form. Elegance, in *arch*, consists in the due symmetry

and distribution of the parts of an edifice, or in regular proportions and arrangement. And in a similar sense, the word is applied to the person or human body. It is applied also to penmanship, denoting that form of letters which is most agreeable to the eye. In short, in a looser sense, it is applied to many works of art or nature remarkable for their beauty; as, *elegance* of dress or furniture.—2. That which pleases by its nicety, symmetry, purity, or beauty. In this sense it has a plural; as, the nicer *elegancies* of art.

EL'EGANT, *a.* [L. *elegans.*] 1. Polished; polite; refined; graceful; pleasing to good taste; as, *elegant* manners. —2. Polished; neat; pure; rich in expressions; correct in arrangement; as, an *elegant* style or composition.—3. Uttering or delivering elegant language with propriety and grace; as, an *elegant* speaker.—4. Symmetrical; regular; well formed in its parts, proportions, and distribution; as, an *elegant* structure.—5. Nice; sensible to beauty; discriminating beauty from deformity or imperfection; as, an *elegant* taste. [This is a loose application of the word; *elegant* being used for *delicate.*]—6. Beautiful in form and colours; pleasing; as, an *elegant* flower. —7. Rich; costly and ornamental; as, *elegant* furniture or equipage.

EL'EGANTLY, *adv.* In a manner to please; with elegance; with beauty; with pleasing propriety; as, a composition *elegantly* written.—2. With due symmetry; with well-formed and duly-proportioned parts; as, a house *elegantly* built.—3. EL'EGIST, *n.* A writer of elegies.

ELE'GIT, *n.* [L. *eligo, elegi,* to choose.] 1. A writ of execution, by which a defendant's goods are apprized and delivered to the plaintiff, and if not sufficient to satisfy the debt, one moiety of his lands are delivered, to be held till the debt is paid by the rents and profits.—2. The title to estate by elegit.

EL'EGY, *n.* [L. *elegia;* Gr. ἐλεγεῖον, ἔλεγος, supposed to be from λέγω, to speak or utter. Qu. the root of the L. *lugeo.* The verbs may have a common origin, for to speak and to cry out in wailing are only modifications of the same act, to throw out the voice with more or less vehemence.] 1. A mournful or plaintive poem, or a funeral song; a poem or a song expressive of sorrow and lamentation.—2. A short poem without points or affected elegancies.

EL'EMENT, *n.* [L. *elementum:* Fr. *élément;* W. *elven,* or *elvyz.* This word Owen refers to *elv* or *el,* a moving principle, that which has in itself the power of motion; and *el* is also a spirit or angel, which seems to be the Sax. *ælf,* an *elf.* Vossius assigns *elementum* to *eleo,* for *oleo,* to grow. *See* ELF.] 1. The first or constituent principle or minutest part of any thing; as, the *elements* of earth, water, salt, or wood; the *elements* of the world; the *elements* of animal or vegetable bodies. So letters are called the *elements* of language. —2. An ingredient; a constituent part of any composition.—3. In *a chemical sense,* an atom; the minutest particle of a substance; that which cannot be divided by chemical analysis, and therefore considered as a simple substance, as oxygen, hydrogen, nitrogen, &c. An *element* is strictly the last result of chemical analysis; that which cannot be decomposed by any means now employed. An *atom* is the last result of mechanical division; that which cannot be any farther divided without decomposition: hence there may be both *elementary* and *compound* atoms.—4. In the *plural,* the first rules or principles of an art or science; rudiments; as, the *elements* of geometry; the *elements* of music; the *elements* of painting; the *elements* of a theory.—5. In *popular language,* fire, air, earth, and water, are called the four *elements,* as formerly it was supposed that these are simple bodies, of which the world is composed. Later discoveries prove air, earth, and water to be compound bodies, and fire to be only the extrication of light and heat during *combustion.*— 6. Element, in the *singular,* is sometimes used for the air.—7. The substance which forms the natural or most suitable habitation of an animal. Water is the proper *element* of fishes; air, of man. Hence,— 8. The proper state or sphere of any thing; the state of things suited to one's temper or habits. Faction is the *element* of a demagogue. —9. The matter or substances which compose the world.

> The *elements* shall melt with fervent heat; 2 Pet. iii.
